

# Unix / Linux - Using Shell Arrays

In this chapter, we will discuss how to use shell arrays in Unix. A shell variable is capable enough to hold a single value. These variables are called scalar variables.

Shell supports a different type of variable called an **array variable**. This can hold multiple values at the same time. Arrays provide a method of grouping a set of variables. Instead of creating a new name for each variable that is required, you can use a single array variable that stores all the other variables.

All the naming rules discussed for Shell Variables would be applicable while naming arrays.

## Defining Array Values

The difference between an array variable and a scalar variable can be explained as follows.

Suppose you are trying to represent the names of various students as a set of variables. Each of the individual variables is a scalar variable as follows –

```
NAME01="Zara"  
NAME02="Qadir"  
NAME03="Mahnaz"  
NAME04="Ayan"  
NAME05="Daisy"
```

We can use a single array to store all the above mentioned names. Following is the simplest method of creating an array variable. This helps assign a value to one of its indices.

```
array_name[index]=value
```

Here *array\_name* is the name of the array, *index* is the index of the item in the array that you want to set, and *value* is the value you want to set for that item.

As an example, the following commands –

```
NAME[0]="Zara"  
NAME[1]="Qadir"  
NAME[2]="Mahnaz"  
NAME[3]="Ayan"  
NAME[4]="Daisy"
```

If you are using the **ksh** shell, here is the syntax of array initialization –

```
set -A array_name value1 value2 ... valuen
```

If you are using the **bash** shell, here is the syntax of array initialization –

```
array_name=(value1 ... valuen)
```

## Accessing Array Values

After you have set any array variable, you access it as follows –

```
${array_name[index]}
```

Here *array\_name* is the name of the array, and *index* is the index of the value to be accessed. Following is an example to understand the concept –

[□ Live Demo](#)

```
#!/bin/sh
```

```
NAME[0]="Zara"  
NAME[1]="Qadir"  
NAME[2]="Mahnaz"  
NAME[3]="Ayan"  
NAME[4]="Daisy"  
echo "First Index: ${NAME[0]}"  
echo "Second Index: ${NAME[1]}"
```

The above example will generate the following result –

```
$/test.sh  
First Index: Zara  
Second Index: Qadir
```

You can access all the items in an array in one of the following ways –

```
${array_name[*]}  
${array_name[@]}
```

Here **array\_name** is the name of the array you are interested in. Following example will help you understand the concept –

[□ Live Demo](#)

```
#!/bin/sh
```

```
NAME[0]="Zara"  
NAME[1]="Qadir"
```

```
NAME[2]="Mahnaz"  
NAME[3]="Ayan"  
NAME[4]="Daisy"  
echo "First Method: ${NAME[*]}"  
echo "Second Method: ${NAME[@]}"
```

The above example will generate the following result –

```
$/test.sh  
First Method: Zara Qadir Mahnaz Ayan Daisy  
Second Method: Zara Qadir Mahnaz Ayan Daisy
```
