Unix / Linux - Shell Loop Types

In this chapter, we will discuss shell loops in Unix. A loop is a powerful programming tool that enables you to execute a set of commands repeatedly. In this chapter, we will examine the following types of loops available to shell programmers –

- The while loop
- The for loop
- The until loop
- The select loop

You will use different loops based on the situation. For example, the **while** loop executes the given commands until the given condition remains true; the **until** loop executes until a given condition becomes true.

Once you have good programming practice you will gain the expertise and thereby, start using appropriate loop based on the situation. Here, **while** and **for** loops are available in most of the other programming languages like **C**, **C++** and **PERL**, etc.

Nesting Loops

All the loops support nesting concept which means you can put one loop inside another similar one or different loops. This nesting can go up to unlimited number of times based on your requirement.

Here is an example of nesting **while** loop. The other loops can be nested based on the programming requirement in a similar way –

Nesting while Loops

It is possible to use a while loop as part of the body of another while loop.

Syntax

```
while command1 ; # this is loop1, the outer loop
do
   Statement(s) to be executed if command1 is true
   while command2 ; # this is loop2, the inner loop
   do
      Statement(s) to be executed if command2 is true
   done

Statement(s) to be executed if command1 is true
```

done

Example

Here is a simple example of loop nesting. Let's add another countdown loop inside the loop that you used to count to nine –

```
#!/bin/sh
a=0
while [ "$a" -lt 10 ]  # this is loop1
do
    b="$a"
    while [ "$b" -ge 0 ] # this is loop2
    do
        echo -n "$b "
        b=`expr $b - 1`
    done
    echo
    a=`expr $a + 1`
```

This will produce the following result. It is important to note how **echo -n** works here. Here **-n** option lets echo avoid printing a new line character.
